

# NORSK-ÍSLENSK VORGOTSSÍLD

## NORWEGIAN SPRING-SPAWNING HERRING

### *Clupea harengus*

#### RÁÐGJÖF – ADVICE

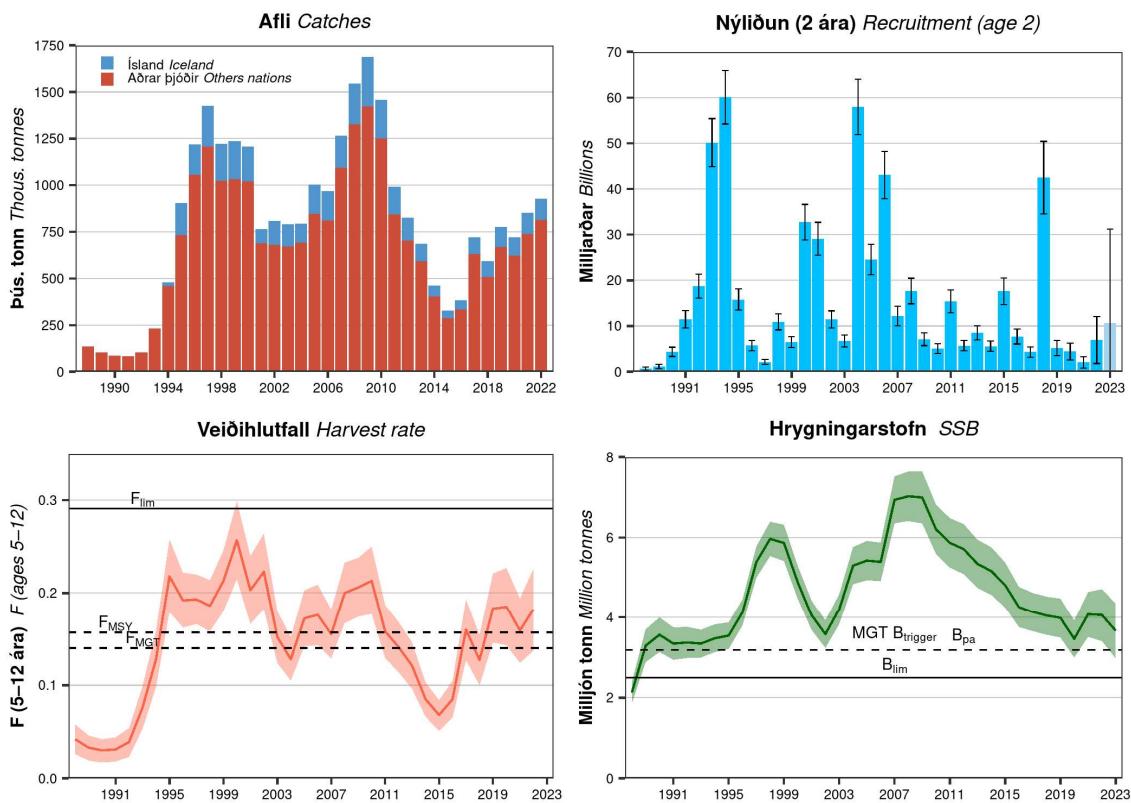

Alþjóðahafrannsóknaráðið (ICES) ráðleggur í samræmi við langtímanýtingarstefnu samþykkta af Evrópusambandinu, Bretlandi, Færeyjum, Íslandi, Noregi, og Rússlandi að afli ársins 2024 verði ekki meiri en 390 010 tonn.

*ICES advises that when the long-term management strategy agreed by the European Union, the UK, the Faroe Islands, Iceland, Norway, and the Russian Federation is applied, catches in 2024 should be no more than 390 010 tonnes.*

#### STOFNPRÓUN – STOCK DEVELOPMENT

Veiðidánartala stofnsins er metin yfir kjörsókn ( $F_{MSY}$ ) og er á milli  $F_{pa}$  og  $F_{lim}$ . Stærð hrygningarstofns er yfir aðgerðarmörkum (MGT  $B_{trigger}$ ), gátmörkum ( $B_{pa}$ ) og varúðarmörkum ( $B_{lim}$ ).

*Fishing pressure on the stock is above  $F_{MSY}$  and between  $F_{pa}$  and  $F_{lim}$ , and spawning-stock size is above MGT  $B_{trigger}$ ,  $B_{pa}$ , and  $B_{lim}$ .*

**Norsk-íslensk vorgotssíld.** Niðurstöður stofnmats. Áætluð nýliðun árið 2023 er sýnd með ljósbláum lit.

**Norwegian spring-spawning herring.** Summary of the stock assessment. The assumed recruitment value for 2023 is shaded in light blue.

## STOFNMAT OG GÁTMÖRK – BASIS OF ASSESSMENT AND REFERENCE POINTS

Forsendor ráðgjafar <i>Basis of the advice</i>	Nýtingarstefna <i>Management strategy</i>
Nýtingarstefna <i>Management strategy</i>	Langtímanýtingarstefna sem var samþykkt af strandíkjum árið 2018 (Anon, 2018) og í framhaldinu af Bretlandi (Anon, 2020). <i>A long-term management strategy was agreed by coastal states in 2018 (Anon, 2018) and subsequently by the UK (Anon, 2020).</i>
Stofnmat <i>Assessment type</i>	Aldursaflalíkan (XSAM; ICES 2016) <i>Statistical age disaggregated assessment model (XSAM; ICES, 2016)</i>
Inntaksgögn <i>Input data</i>	Stofnmatið nær til áranna 1988–2023: aldursgreindur afli (stofnþyngdir byggðar á þyngd eftir aldri úr leiðöngrum, og frá 2009 á sýnatökum úr afla). Þrjár leiðangursvítilor: Norskur bergmálsleiðangur á hrygningarsvæðum í febrúar/mars (NASF, 1994–2005, 2015–2023); Alþjóðlegur vistfræðileiðangur í Austurdjúpi í maí (IESNS) sem nær yfir fullorðna hluta stofnsins í Noregshafi (1996–2023) og tveggja ára síld í Barentshafi árin 1991–2019 og 2021 (enginn leiðangur var farinn 2020 og 2022–2023). Kynproskahlutfall eftir aldri háð stærð árgangs. Fastur náttúrulegur dauði ákværðaður frá eldri gögnum (settir sem 0.9 fyrir tveggja ára og 0.15 fyrir eldri en tveggja ára). <i>Assessment period 1988–2023: commercial catches-at-age (stock weight-at-age from surveys and, since 2009, from catch sampling). Three survey indices: Norwegian acoustic survey on spawning grounds in February/March (NASF [A7918]; 1994–2005, 2015–2023); International Ecosystem Survey in the Nordic Seas (IESNS; A3675) covering the adult stock in the Nordic seas (1996–2023), and the juvenile stock in the Barents Sea 1991–2019 and 2021 (no survey was conducted in 2020 and 2022–2023). Proportion mature depends on year-class size. Natural mortalities are fixed values from historical analyses (age 2 = 0.9; ages greater than 2 = 0.15).</i>

Nálgun <i>Framework</i>	Viðmiðunarmörk <i>Reference point</i>	Gildi <i>Value</i>	Grundvöllur <i>Technical Basis</i>
MSY nálgun <i>MSY approach</i>	MSY $B_{trigger}$	3.184	$B_{pa}$ ; í milljónum tonna <i><math>B_{pa}</math>; in million tonnes</i>
	$F_{MSY}$	0.157	Slembihermanir byggðar á Beverton-Holt, skiptri aðhvarfsgreiningu og Ricker stofn-nýliðunar samböndum, en er að hámarki jafnt $F_{P05}$ <i>Stochastic simulations with Beverton–Holt, segmented regression, and Ricker stock-recruitment relationships, capped to <math>F_{P05}</math></i>
Varúðarnálgun <i>Precautionary approach</i>	$B_{lim}$	2.5	MBAL (samþykkt 1998); í milljónum tonna <i>MBAL (accepted in 1998); in million tonnes</i>
	$B_{pa}$	3.184	Byggt á $B_{lim}$ og stofnmatsóvissu. $B_{lim} \times \exp(1.645 \times \sigma)$ , með $\sigma = 0.147$ ; í milljónum tonna <i>Based on <math>B_{lim}</math> and assessment uncertainties. <math>B_{lim} \times \exp(1.645 \times \sigma)</math>, with <math>\sigma = 0.147</math>; in million tonnes</i>
	$F_{lim}$	0.291	Mismunandi svíðsmyndir metnar með slembinni nýliðun: F gildið samsvarar 50% líkum á SSB < $B_{lim}$ <i>Equilibrium scenarios with stochastic recruitment: F value corresponding to 50% probability of (SSB &lt; <math>B_{lim}</math>)</i>
	$F_{pa}$	0.157	$F_{P05}$ ; F sem leiðir til SSB $\geq B_{lim}$ með 95% líkum <i><math>F_{P05}</math>; the F that leads to SSB <math>\geq B_{lim}</math> with 95% probability</i>
Langtímanýtingarstefna ESB, Færeyja, Íslands, Noregs og Rússlands <i>EU-Faroes-Iceland-Norway- Russian Federation long-term management strategy</i>	$SSB_{mgt\_lower}$	2.5	Nýtingarstefna byggð á varúðarnálgun metin með nýtingastefnuhermunum. Stærð hrygningarstofns í milljónum tonna. <i>Precautionary HCR evaluated by MSE. SSB values in million tonnes</i>
	$SSB_{mgt}$	3.184	
	$F_{mgt\_lower}$	0.05	
	$F_{mgt}$	0.14	

**HORFUR – PROSPECTS**

**Norsk-íslensk vorgotssíld.** Forsendur fyrir stofnmatsárið og í framrekningum.

**Norwegian spring-spawning herring.** Assumptions made for the interim year and in the forecast.

Breyta Variable	Gildi Value	Athugasemdir Notes
$F_{5-12+}$ ára (2023) $F_{ages\ 5-12+}$ (2023)	0.186	Samkvæmt áætluðum afla 2023 Based on assumed catches in 2023
Hrygningarástofn (2024) SSB (2024)	3 059 464	Byggð á stofnmati; í tonnum From the assessment; in tonnes
Nýliðun 2 ára (2024) Recruitment age 2 (2024)	10.619	Miðgildi nýliðunar áranna 1988–2022; í milljörðum Median stochastic recruitment based on the years 1988–2022; billions
Nýliðun 2 ára (2025) Recruitment age 2 (2025)	10.619	Meðaltal nýliðunar áranna 1988–2022; í milljörðum Median stochastic recruitment based on the years 1988–2022; billions
Afl (2023) Catch (2023)	692 942	Samanlagt aflamark veiðipjóða; í tonnum Sum of declared unilateral quotas; tonnes

**Norsk-íslensk vorgotssíld.** Áhrif mismunandi aflamarks. Allar þyngdir eru í tonnum.

**Norwegian spring-spawning herring.** Annual catch scenarios. All weights are in tonnes.

Grunnur Basis	Afl (2024) Catch (2024)	Veiðidánartala (2024) $F_{5-12+}$ (2024)	Hrygningarástofn (2025) SSB (2025)	% Breyting á hrygningarástofni <sup>1)</sup> % SSB change <sup>1)</sup>	% Breyting á afla <sup>2)</sup> % catch change <sup>2)</sup>	% Breyting á ráðgjöf <sup>3)</sup> % Advice change <sup>3)</sup>	% líkur að hrygningarástofn fari undir $B_{lim}$ 2025 % probability of SSB falling below $B_{lim}$ in 2025
Samþykkt nýtingarstefna Agreed management strategy	390 010	0.124	2 913 275	-5	-44	-24	15.7
$F = F_{2023}$	570 511	0.186	2 759 039	-10	-18	12	27.7

<sup>1)</sup> Hrygningarástofn árið 2025 miðað við hrygningarástofn árið 2024 (3 059 464 t) – SSB in 2025 relative to SSB in 2024 (3 059 464 t)

<sup>2)</sup> Afl árið 2024 miðað við áætlaðan afla ICES árið 2023 (692 942 t) – Catch in 2024 relative to ICES estimated catch in 2023 (692 942 t)

<sup>3)</sup> Ráðlagt aflamark fyrir árið 2024 miðað við ráðlagt aflamark árið 2023 (511 171 t) – Advice value 2024 relative to advice value 2023 (511 171 t)

Ráðgjöf ársins 2024 er 24 % lægri en árið 2023 vegna: (1) hrygningarástofn er að minnka vegna lélegrar nýliðunar síðan stóri árgangurinn frá árinu 2016 kom inn í stofninn; og (2) (2)  $F$  advised er减少了 compared to last year since the SSB in 2024 is predicted to be below  $SSB_{mgt}$  (=MSY  $B_{trigger}$ ).

The advice for 2024 is 24% lower than for 2023 because: (1) the adult stock size is declining as a result of low recruitment since the large 2016 year class; and (2)  $F$  advised is reduced compared to last year since the SSB in 2024 is predicted to be below  $SSB_{mgt}$  (=MSY  $B_{trigger}$ ).

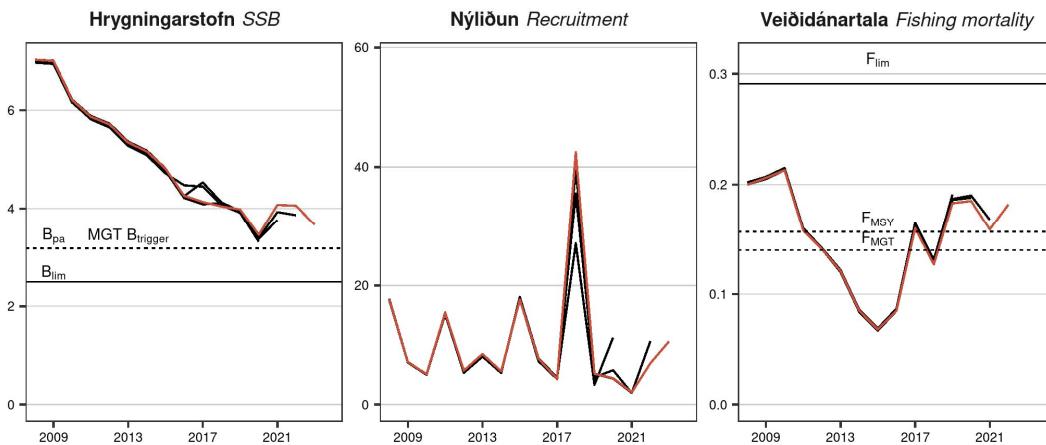

**GÆÐI STOFNMATS – QUALITY OF THE ASSESSMENT**

Áætluð stærð hrygningarástofns og veiðidánartala eru í samræmi við stofnmat síðasta árs. Mat á stærð árgangsins frá árinu 2016 hefur hækkað frá mati fyrrí ára.

Stofnmælingaleiðangur Rússa í Barentshafi í maí fell niður árin 2022 og 2023. Engar leiðangursvísitölur eru því til um tveggja ára síld. Í framrekningum á stofnstærð var nýliðun því ákvörðuð sem miðgildi nýliðunar yfir árin 1988–2022. Þetta hefur þó engin áhrif á ráðlagðan afla.

The estimated SSB and fishing mortality are consistent with the estimates from last year's assessment. The 2016 year class has been revised upward over the last years.

The Russian Barents Sea survey (IESNS; A3675) was not conducted in 2022 or 2023. There was no survey information on age 2, and therefore median stochastic recruitment based on the years 1988–2022 was used instead in the forecast. However, this has no impact on the advised catches.

Norsk-íslensk vorgotssild. Samanburður á stofnmati áranna 2019–2023 (rauð lína: 2023).

*Norwegian spring-spawning herring. Current assessment (red line: 2023) compared with previous estimates (2019–2022).*

## AÐRAR UPPLÝSINGAR – OTHER INFORMATION

Aflí íslenskra skipa úr norsk-íslenska síldarstofninum árið 2022 var 112 739 tonn og var allur veiddur í flotvörpu. Rúmlega 90 % aflans fékkst innan íslenskrar lögsögu og 10 % í Síldarsmugunni. Veiðar úr stofninum voru stundaðar í júní–nóvember og var mest veitt í september (47 %) og október (40 %). Heildaraflí allra þjóða úr stofninum árið 2022 var 813 834 tonn.

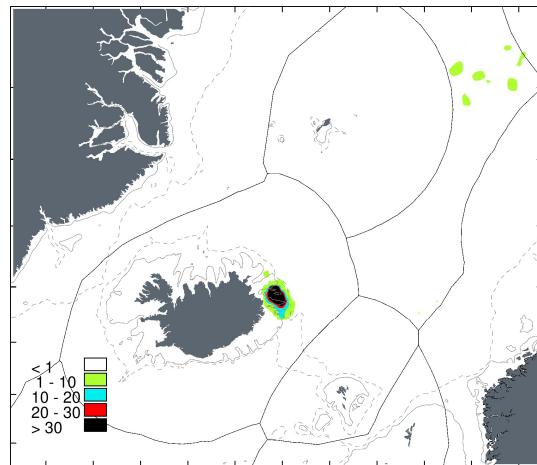

Gert er ráð fyrir að árgangurinn frá árinu 2016 verði uppistaða aflans árið 2024 (45%). Árgangar þar á eftir eru metnir slakir.

Niðurstöður stofnmatsins sýna að stærð hrygningarstofns árið 2025 verður undir aðgerðarmörkum nýtingarstefnu (SSB<sub>mgt</sub>) jafnvel þótt aflareglu verði fylgt árið 2024.

Veiðar úr stofninum hafa verið umfram ráðgjöf síðan árið 2013. Ráðgjöfin byggir á fiskveiðidauða samkvæmt langtímanýtingarstefnu sem samþykkt var af Evrópusambandinu, Færeyjum, Íslandi, Noregi og Rússlandi. Þar er ekki gert ráð fyrir frávikum frá ráðlögðu aflamarki sem er hins vegar reyndin eins og sjá má af samanlöögðu einhliða aflamarki ríkjanna. Við prófanir á aflareglunni var ekki tekið tillit til að afli færí kerfisbundið umfram ráðgjöf samkvæmt nýtingarstefnu (ICES, 2016). Það getur leitt til þess að veiðarnar uppfylli ekki varúðarsjónarmið og að stærð hrygningarstofns fari undir varúðarmörk og skili minni afrakstri til lengri tíma litið.

*The Icelandic catch of Norwegian spring-spawning herring in 2022 was 112 739 tonnes, all caught with pelagic trawl. About 90% of the catches were taken within the Icelandic EEZ and 10% in international waters. The fishery took place in June to November with the highest catches in September (53%). The total catch of all nations in 2022 amounted to 813 834 tonnes.*

*The 2016 year class is expected to dominate the catches in 2024 (45%), and the subsequent year classes recruiting to the fishery are estimated to be weak.*

Norsk-íslensk sild. Veiðisvæði íslenskra skipa árið 2022 (t/sjm<sup>2</sup>)

*NSS herring. Fishing grounds of the Icelandic fleet in 2022 (t/nmi<sup>2</sup>)*

*SSB is predicted to be below SSB<sub>mgt</sub> in 2025 even if the management plan is applied in 2024.*

*There has been an overshoot of the catches in relation to the advised TAC since 2013. The advice is based on the target fishing mortality in the long-term management strategy agreed by the European Union, the Faroe Islands, Iceland, Norway, and the Russian Federation; it does not consider the deviations from the long-term management strategy as evident from the sum of declared unilateral quotas. During the evaluation of the long-term management strategy (ICES, 2018a), the implementation error in the form of a consistent overshoot of the TAC was not included. Therefore, failing to adhere to the advised catches as derived from the application of the long-term management strategy may not be precautionary. Specifically, this may result in an increased risk for the stock to fall below B<sub>lim</sub> and loss of catch in the long term.*

## RÁÐGJÖF, AFLAMARK OG AFLI – ADVICE, TAC AND CATCH

**Norsk-íslensk síld.** Tillögur um hámarksbla, aflamark samkvæmt ákvörðun stjórvalda og afli (tonn).

**Norwegian spring-spawning herring.** Recommended TAC, national TAC, and catches (tonnes).
